

Proxy System Modeling: Characterizing Uncertainty in Proxy Records Climate Data-Model Integration

Dr Sylvia Dee

Climate Models

PMIP3, PMIP4
CCSM3 (TRACE)
LOVECLIM
FAMOUS

input: BCs, ICs

model:

output: T, P, q, \vec{u}

Lake Proxy System Model

Environment Model

- * Lake Energy Balance
- * Temperature Profile
- * Seasonality
- * Mixing

Sensor Model

- * Proxy - Temperature response
- * Calibration Uncertainty

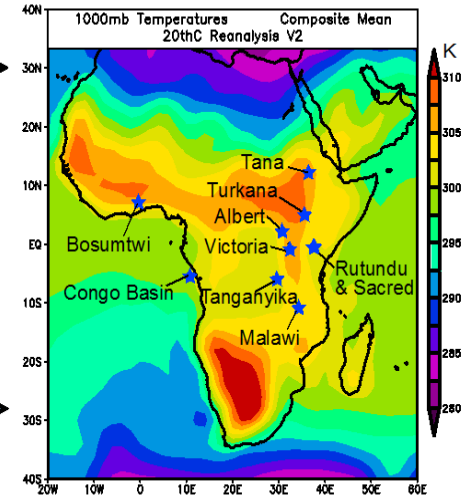

Archive Model

- * Sedimentation
- * Compaction
- * Bioturbation (TURBO2)

Observation Model

- * Chronological & Analytical Uncertainty
- * BCHRON

Temperature Observations

brGDGTs, $\delta^{18}O$, δD_{wax} ,
multivariate response, dating errors
+ Proxy Response Uncertainties +

Used for:

Lake level, temperature, mixing, salinity, lake water and CaCO₃ isotopes (need isotope-enabled model), leaf wax dD (need isotopes + veg)

Flood deposits?

Inputs:

Climate-model-grade inputs of surface mass and energy fluxes

Lake characteristics and sed rate information

Value:

Characterize and quantify multiple sources of uncertainty of reconstruction (chronologic, proxy calibration, environmental and sedimentary modification of proxy)

Sensitivity testing of proxy to climate (perturbation experiments)

Data-model integration
